Surface metrology is the measurement of small-scale features on surfaces, and is a branch of metrology. Surface primary form, surface fractality and surface roughness are the parameters most commonly associated with the field. It is important to many disciplines and is mostly known for the machining of precision parts and assemblies which contain mating surfaces or which must operate with high internal pressures. Surface finish may be measured in two ways: contact and non-contact methods. Contac

A Freeform surface, called a "Shell" in Mountains <sup>®</sup>, is a point cloud (x,y,z) associated with connectivity information so that all points are connected in a triangle mesh in space. That way, the complete surface around an object can be coded. It also allows coding of undercut structures or internal cavities (see example image below).

The nature of surface texture is based on the lateral wavelength of irregularities. Geometrical form and form errors are excluded from surface texture, leaving three components: primary profile, roughness profile and waviness profile, each separated by filters. Roughness is by far the most common surface characteristic, having an important impact on surface functions such as wear or friction.
